SUOMESSA SOVELLETTAVA TOIMINTATAPA ILMATILASSA, JOSSA ESIINTYY VULKAANISTA TUHKAA

Julkaisupäivä 16.10.2014

Finavia julkaisee tämän AIC:n EACCC:n (European Aviation Crisis Coordination Cell) toimeksiantona koskien Suomessa sovellettavaa lähestymistapaa toimia ilmatilassa, jossa esiintyy vulkaanista tuhkaa.

MANAGEMENT OF VOLCANIC ASH EVENTS IN FINLAND

Publication date 16 OCT 2014

This AIC concerning the management of volcanic ash events in Finland is published by Finavia due to the EACCC (European Aviation Crisis Coordination Cell) mandate.

Additional information:

VOLCANIC ASH

1. Introduction

The purpose of this AIC is to provide operators, owners and maintenance organisations with new guidance on aircraft operations where volcanic ash contamination may be a hazard for flight operations.

2. Key principles

The operator is responsible for the safety of its operations under the oversight of their respective State regulatory authority. The guiding principle for such operations is the use of a safety risk management approach, as described in ICAO Doc 9974 and [EASA Safety Information Bulletin \(SIB\) 2010-17R5](#).

In order to consider whether or not to operate into airspace forecast to be, or aerodromes known to be, contaminated with volcanic ash, the operator should have in place an identifiable safety risk assessment (SRA) within its Safety Management System (SMS).

In order to decide whether or not to operate into airspace forecast to be, or aerodromes known to be, contaminated with volcanic ash, the operator's SRA must be accepted by its State regulatory authority.

The safety control measures set out in ICAO Doc 9974 and [EASA Safety Information Bulletin \(SIB\) 2010-17R5](#) are intended to be sufficiently robust that they facilitate acceptance, without further investigation, by a State whose airspace is forecast to be affected by volcanic ash. The State can - based on the implementation of internationally accepted Safety Management principles - be confident in the ability of operators from other States to undertake operations safely in its airspace.

3. Terminology

The following definitions of contamination are applicable in Finland regarding operation of aircraft in airspace contaminated with volcanic ash.

./..

Area of Low Contamination: Airspace of defined dimensions where volcanic ash may be encountered at concentrations equal to or less than $2 \times 10^{-3} \text{ g/m}^3$. (Cyan)

Area of Medium Contamination: Airspace of defined dimensions where volcanic ash may be encountered at concentrations greater than $2 \times 10^{-3} \text{ g/m}^3$, but less than $4 \times 10^{-3} \text{ g/m}^3$. (Grey)

Area of High Contamination: Airspace of defined dimensions where volcanic ash may be encountered at concentrations equal to or greater than $4 \times 10^{-3} \text{ g/m}^3$, or areas of contaminated airspace where no ash concentration guidance is available. (Red)

These definitions are consistent ICAO EUR/NAT Volcanic Ash Contingency Plan (VACP) (ICAO EUR Doc 019/NAT Doc 006 Part II) and EASA Safety Information Bulletin (SIB) 2010-17R5.

4. SRA application in Finland

4.1 Areas of ash contamination

In Finland Aircraft Operators will be allowed to make decisions based on their SRA in the forecast areas of low, medium and high ash contamination.

Therefore, Finland will allow operators to make decisions based on their SRA, as accepted by Finnish Transport Safety Agency (Trafi), in forecast areas of low, medium and high ash contamination.

4.2 Common SRA recognition

As part of its overall decision making process regarding the operation of aircraft in airspace forecast to be, or aerodromes known to be, contaminated with volcanic ash, Finland will allow aircraft operators registered in other States to base their decisions on their SRA, as accepted by their State regulatory authority, in accordance with the above mentioned approach (see 4.1) to decision making in Finland.
